1. Occupancy time violation

This logic allows you to calculate the time the car stays in the parking lot. Two ANPR cameras at the entrance and exit identify the vehicle, and the operator sets the time paid by the client. If the duration of the vehicle's stay is more than the paid time, then a violation signal is given.

2. Lists and Alerts (with Milestone events)

This business logic allows the user to configure several types of lists of offenders on the road, e.g., trucks that are forbidden to enter the city center, VIP person's list or unscrupulous customers who don't pay at the gas station, etc.

As soon as Data Factory identifies the offender based on the data from the ANPR camera in real time, and, after comparing it with a given list, a warning pops up.

This business logic allows you to send Milestone Alarms and Milestone Analytic events (in VMS mode) according to group settings (in VMS mode only).

In addition, Group Name, GPS coordinates and recognition data, as well as vehicle snapshot received from the camera are also sent inside Analytic events.

To send Analytic events you must set the basic settings according to the arrow. These settings apply only to Analytic events.

Show alert according to group settings Import Export

Group Name	Description	Alert type	
Auto theft	Police data	Milestone Alert	
Garbage trucks	Wrong way of movement	Milestone Analytic	
Defaulters	Gas station	PopUp	
DF Test Analytic Event with GPS	Private area (for taxi)	Milestone Analytic	
Dangerous behavior	Public road	no	
City transit violators	Heavy Trucks	yes	

For the correct Millstone Analytic event sending you have to set basic parameters.
Group Name should be registered as Analytic Event name in the Management client

Cargo-logic allows customers to analyze the traffic of trucks with trailers from a whole network of logistics centers or border control centers.

ANPR camera detects the front license plate number and vehicle type as well as the rear trailer number plate. It then sends all the data to FF Data Factory where the logistics center operator can check the license plates for compliance and receive an alert of the truck's "entry/exit" status; or, in case of a violation (eg., a trailer number mismatch), the operator can prohibit the entry or exit with a warning signal.

Vehicle movement scheme

The time between recognition events on entry-exit cameras should not exceed 15 seconds (during this time, both cameras should recognize both the tractor and the semitrailer)

4. Time within area

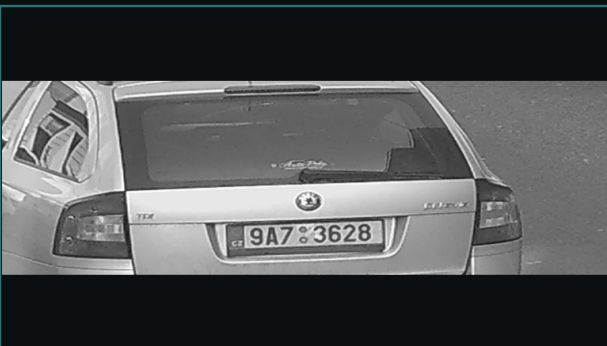

FF Data Factory works quickly with lists and issues reports on vehicles' time spent in parking networks or in the parking lots of restaurants or shopping malls.

For example, restaurant owners are interested in how much time the client spends on their premises or how many visitors come by per day. This allows them to generate a client/visitor profile and effectively plan the staffing of the restaurant.

5. City Stat

Business logic for vehicle statistics helps to administer traffic in a city and plan new road infrastructure. The client can receive a different configuration of transport data by type, brand and model at different time periods and other parameters.

What's more, such statistics can be used in marketing campaigns to determine which vehicle brand passes most often by a given section of the road indicating optimal locations for the placement of targeted ads.

6. NCIC violators

This business logic was developed for the USA. In the Data Factory you can import a vehicle list of violators from the NCIC database (central database for tracking crime-related information). If the ANPR cameras that are connected to Data Factory capture a suspicious vehicle from NCIC, then the police receive an alert.

7. Average speed

One of the most popular traffic management features “average speed control” is implemented in Data Factory. For this, a user needs to select 2 points of speed control, distance between them and Data Factory calculates the average speed.

Once the offender has been identified, the data is transferred to the police. Moreover, you can get statistics of violations by day and by route to determine where to set up a police patrol.

8. Free parking spaces

Keeping a count of cars that enter a parking lot to determine the number of free spaces is another useful business logic. All it takes is to set the number of total spaces and enter the cars that are currently there, and start the process of counting free spaces. Our business logic allows you to book online parking spaces, as well as conduct statistical analysis of work by day, week or month.

9. Factory truck to city

How can you regulate the movement of trucks according to a given route (waybill)?

Data Factory has a logic that allows the logistics operator at a business to control the truck's route. Cameras installed at the business and in the city transmit data about the truck to the control point. If a truck by mistake violates the route and, therefore, the rules for entering the city, the operator can quickly correct its route.

Camera timeout, min: 5 Set timeout Refresh time, sec: 5 Set refresh time

Data Factory makes sure that information arrives on time and from all cameras installed at the facility. The client enters a list of cameras and receives real-time data from each camera. If, during the set time, for example 5 minutes, the camera does not send data to Data Factory, then a signal appears on the dashboard that something is wrong with the camera.

Thus, the client can respond to the technical problems of the camera and receive objective data in time.

11. Chain Builder

Using this logic, you can build a chain (traffic route) of customer behavior on the territory of a facility, such as a car wash, a comprehensive car service or a logistics center.

This allows you to make inferences about the preferences of the client, for example, what service and services he uses, and, as a result, build a marketing campaign, or client program

Active Chains Export

13. Multilevel Parking

With the proposed logic, the client can control the number of free spaces in each parking lot from a single point. Data Factory has the ability to build a consolidated dashboard that displays data from all parking levels.

Free places can be distributed by the parking operator or they will be displayed on the parking display and the user will make his own choice.

14. Occupancy time violation (multi cam)

This logic allows you to calculate the time the car stays in the parking lot.

Several ANPR cameras at the entrance and exit identify the vehicle, and the operator sets the time paid by the client. If the duration of the vehicle's stay is more than the paid time, then a violation signal is given.

15. Wrong parking place occupied

Well solves the problem for the Warehouses with several parking spaces. At the entrance, the operator determines a specific parking for the car. If the car has not entered the right parking space assigned to it, then the operator sees the violator on the dashboard (the car is highlighted in red).

*Wrong parking means that the driver arrived at the wrong place of loading / unloading

16. Events proxy

The smart camera can only send data to the receiving system to which it is connected. If you increase the number of points where you need to send data, it may not match the capabilities of the camera.

Therefore, you can create a list of receiving systems in Data Factory where you need to send data from cameras or analyze events. Such a service will be in high demand by parking network operators as well as by central police and municipalities, etc., which have to receive the data from the same cameras but in separate computer/network systems.

Click on the table's row to send event to DataFactory receivers (make sure, that camera with "Serial №" is registered in SETTINGS) Import Export

192.168.1.107

This business logic allows you to manage cameras and their ANPR applications from a single place.

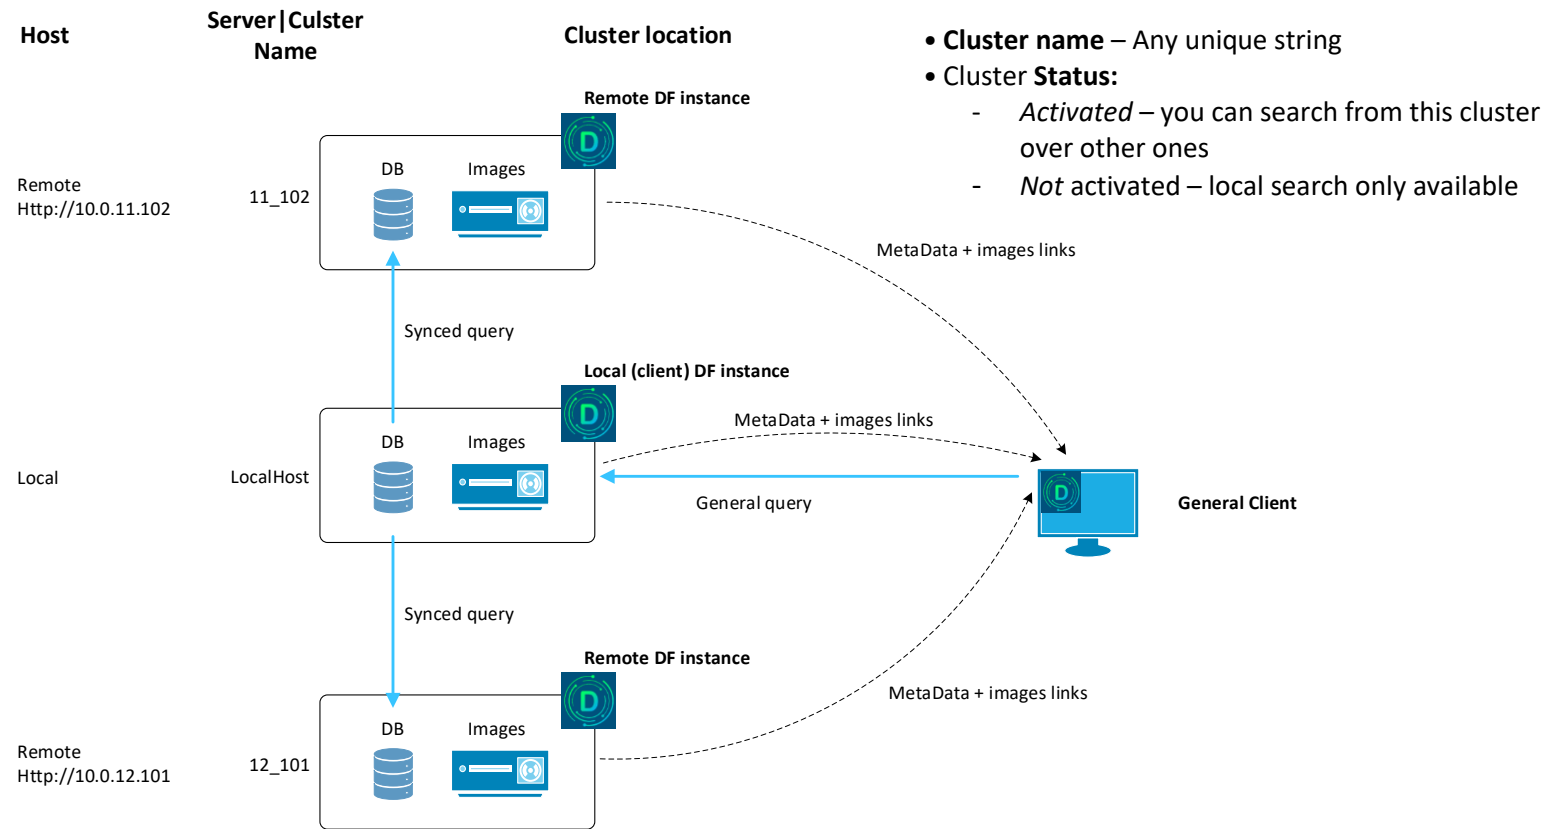

Just enter the Camera name, IP, Login, Password, and Connection Type (depends on ANPR application) – all other settings and information become able.

From here you can also analyze the health status of each camera in many ways.

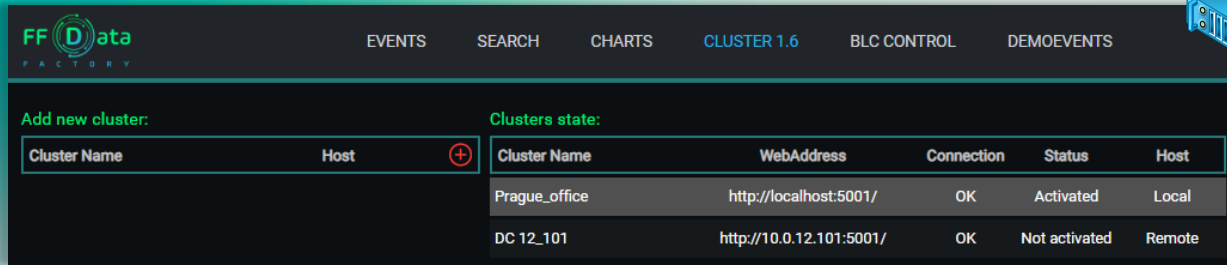

18. Clustered DataFactory

Make you able to search and interact across several instances of DataFactory, located on remote hosts

2 Clusters example (One search direction)

FF Data Factory interface showing cluster configuration. The 'CLUSTER 1.6' tab is active. The 'Clusters state' table lists two clusters: Prague_office (Local, Activated) and DC 12_101 (Remote, Not activated).

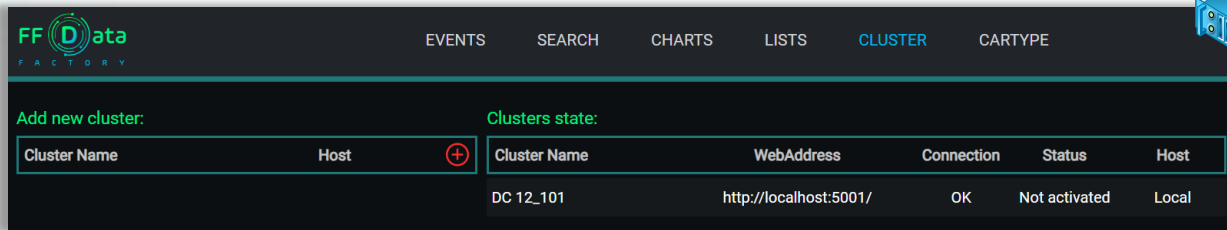

Cluster Name	WebAddress	Connection	Status	Host
Prague_office	http://localhost:5001/	OK	Activated	Local
DC 12_101	http://10.0.12.101:5001/	OK	Not activated	Remote

Cluster/server name

Prague_office

The main cluster from which the search is carried out

FF Data Factory interface showing cluster configuration. The 'CLUSTER' tab is active. The 'Clusters state' table lists two clusters: DC 12_101 (Local, Not activated) and Prague_office (Remote, Activated).

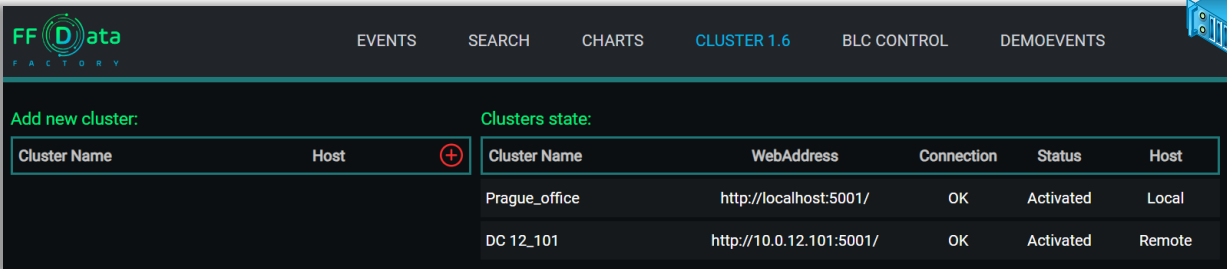

Cluster Name	WebAddress	Connection	Status	Host
DC 12_101	http://localhost:5001/	OK	Not activated	Local
Prague_office	http://10.0.12.101:5001/	OK	Activated	Remote

DC 12_101

Secondary cluster – Business logic for clusters does not need to be installed, so Search on this server will be processed only inside it

2 Clusters example (Cross-search)

FF Data Factory interface showing cluster configuration. The 'CLUSTER 1.6' tab is active. The 'Clusters state' table lists two clusters: Prague_office (Local, Activated) and DC 12_101 (Remote, Activated).

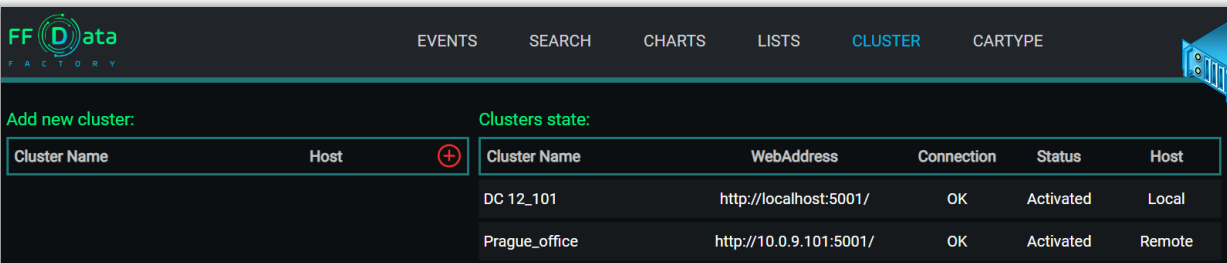

Cluster Name	WebAddress	Connection	Status	Host
Prague_office	http://localhost:5001/	OK	Activated	Local
DC 12_101	http://10.0.12.101:5001/	OK	Activated	Remote

Prague_office

One of the equivalent clusters. The search is carried out in both clusters

Business logic for clusters must be installed on both clusters. Both clusters must have activated status

FF Data Factory interface showing cluster configuration. The 'CLUSTER' tab is active. The 'Clusters state' table lists two clusters: DC 12_101 (Local, Activated) and Prague_office (Remote, Activated).

Cluster Name	WebAddress	Connection	Status	Host
DC 12_101	http://localhost:5001/	OK	Activated	Local
Prague_office	http://10.0.9.101:5001/	OK	Activated	Remote

DC 12_101

One of the equivalent clusters. The search is carried out in both clusters

19. Gmail API configuration

Configure and test your Gmail configuration so you may be able to use it inside other Business logics

Gmail Client Settings:

Finally, your Data Factory is activated

22. Car types statistic

This Business-logic will display vehicle statistics for different sections. Including dependency on the selected camera and the selected day

23. Logging mode (BLC controller)

Set the level of Business-logic logging

The more detailed the level, the better it is to debug, the worse the performance for high-load systems

Recommended log-level is **Debug**

The screenshot shows the 'Running Business logics list' in the FF Data Factory interface. The table lists various business logics with their ports, IDs, statuses, and active IDs. The 'av speed1' logic (Port 10005) is highlighted. To the right, the 'Logging parameters' section shows the log level set to 'Error' for the selected port. A blue callout box explains that 'Error' is the recommended log level for high-load systems because only critical errors will be logged.

Parameter	mapName
Log level	Debug
Retained file count limit	10
Retained file time limit	7.00:00:00

Set parameters for selected port:

Select log level: Error

Error

Set File Count Limit

10

Set File Time Limit

7.00:00:00

For high-load systems recommended log level is **"Error"**
That means that only critical errors will be logged
