

SIFER Card Hole Punch Location

All variants of SIFER ISO cards are punch-able in two locations.

There is a small dot printed on one short side, this is the punch centre position for the short side.

The punch position on the long side can be located with the card facing dot side up and the dot positioned to the left-hand side, the long side punch position will be 5.00mm down from the top long edge and 42.8mm in from either short side.

The maximum punch dimensions are 1.50mm by 8.00mm with the long edge of the hole parallel to the edge of the card being punched.

Punching a hole of the correct dimensions in the correct location will not impact on the SIFER cards warranty.
